Catathelasma

Catathelasma is a scientific journal published by the Slovak Mycological Society with the financial support of the Slovak Academy of Sciences

Editor in chief: Viktor Kučera

Editorial board: Pavel Lizoň & Soňa Jančovičová

Graphic and Cover Design: Erika Pisarčíková

Back issue of Catathelasma can be accessed at www.mykospol.sk/publikacia-cinnost/

Table of Contents

Hygrocybe (genera *Hygrocybe*, *Gliophorus*, *Porpolomopsis* and *Cuphophyllus*) in northwestern Slovakia, part III.

Filip Fuljer, Milan Zajac,
Zuzana Václavová & Ivona Kautmanová 5

Perrotia flammea (Helotiales) in Slovakia
Adam Polhorský & Ján Červenka 57

Editor's Acknowledgements

The Editor express his appreciation to Vladimír Kunca (Technical univerzity in Zvolen, Slovakia), Kadri Pärtel (University of Tartu, Estonia), Eugene Popov (Komarov Botanical Institute, RAS, St. Petersburg, Russia) and Hana Ševčíková (Moravian Museum, Brno, Czech Republic) who have, prior to the acceptance for publication, reviewed, read and commented contributions included in this issue.

1335-7670

Instructions to Authors

Catathelasma publishes original and reviewed contributions to the better knowledge of fungi preferably in Slovakia and central Europe. Papers should be on diversity (mycofloristics), ecology, taxonomy and nomenclature, conservation of fungi, and book reviews and notices. Manuscripts have to be submitted in English with a Slovak or Czech summary.

Elements of an article submitted to Catathelasma

- title: informative and concise
- author's name: full first and last name
- author's mailing and e-mail addresses
- key words: max. 5 words, not repeating words in the title
- text: written in Arial, without any special type of text formatting except for italic and bold options, not exceeding 15 pages
- figures: line drawings, photographs, diagrams and/or graphs (scanned and "jpg" or "tif" formatted) with their legends should be self-explanatory; legends to the figures must be written at the end of the text file
- abstract/summary in Slovak or Czech: max. 10 lines (starting with author's name and the title of the article); the journal is responsible for the translation of abstracts into Slovak for foreign authors
- studied voucher specimens should be kept in the public herbaria
- list of references:
 - **journal article:** Kučera, V. 2011. Cudoniella acicularis. *Catathelasma* 13: 25–27.
 - **book:** Dennis, R. W. G. 1978. British Ascomycetes. Vaduz.
 - **book chapter:** Verbeken, A. & Vesterholz, J. 2012. Lactarius Pers. In: Knudsen, H. & Vesterholz, J. (eds.), *Funga Nordica*, p. 118–144, Copenhagen.

Fuljer, F., Zajac, M., Václavová, Z., Kautmanová, I. 2019. *Hygrocybe* (genera *Hygrocybe*, *Gliophorus*, *Porpolomopsis* and *Cuphophyllus*) in northwestern Slovakia, part III. *Catathelasma* 20: 5–55.

There were recorded 33 taxa of genera *Hygrocybe* s. lat. (*Hygrocybe*, *Gliophorus*, *Porpolomopsis* and *Cuphophyllus*) during our mycological research (2014–2018) in Jablunkovské medzihorie Mts., Javorníky Mts., Kysucké Beskydy Mts., Kysucká vrchovina Mts., Moravsko-sliezske Beskydy Mts. and Turzovská vrchovina Mts. This article presents summary of our collections and follows our research carried out in 2008–2013. Taxa of *Hygrocybe* s. lat. were found collected in 108 localities(96 grasslands, 11 peat bogs and 1 heathland), including rare and very rare species, such as *Cuphophyllus flavipes*, *Cuphophyllus fornicatus*, *Hygrocybe constrictospora*, *Hygrocybe ingrata*, *Hygrocybe intermedia*, *Hygrocybe ovina*, *Hygrocybe russocoriacea* and *Hygrocybe splendidissima*. On the other hand, some of rare European species, as *Gliophorus laetus*, *Hygrocybe citrinovirens*, *Hygrocybe ingrata* and *Porpolomopsis calyptiformis*, are common in studied area. Two varieties *Hygrocybe pratensis* var. *pallida* and *Hygrocybe virginea* var. *fuscescens* were collected as new for the surveyed area too.

Fuljer, F., Zajac, M., Václavová, Z., Kautmanová, I. 2019. Lúčnice rodov *Hygrocybe*, *Gliophorus*, *Porpolomopsis* a *Cuphophyllus* na severozápadnom Slovensku, III. časť. *Catathelasma* 20: 5–55.

V rokoch 2014–2018 bolo zaznamenaných 33 taxónov lúčnic z rodu *Hygrocybe* s. lat. (*Hygrocybe*, *Gliophorus*, *Porpolomopsis* a *Cuphophyllus*) na severozápadnom Slovensku v geomorfologických celkoch Jablunkovské medzihorie, Javorníky, Kysucké Beskydy, Kysucká vrchovina, Moravsko-sliezske Beskydy a Turzovská vrchovina. V tomto článku nadvädzujeme na výskum druhov rodu *Hygrocybe* s. lat. realizovaný v rokoch 2008–2013. Celkovo bolo zaznamenaných 108 lokalít s výskytom taxónov rodu *Hygrocybe* s. lat. (96 lúk a pasienkov, 11 rašelinísk, 1 vresovisko). Ďalej bolo objavených niekoľko nových lokalít v Európe veľmi vzácnych druhov: *Cuphophyllus flavipes*, *Cuphophyllus fornicatus*, *Hygrocybe constrictospora*, *Hygrocybe intermedia*, *Hygrocybe ovina*, *Hygrocybe russocoriacea*, *Hygrocybe splendidissima*. Niektoré vzácné druhy v Európe ako *Gliophorus laetus*, *Hygrocybe*

citrinovirens, *Hygrocybe ingrata* a *Porpolomopsis calyptiformis* sú bežnými taxónmi na našom študovanom území. Nájdené boli tiež dve variety a to *Hygrocybe pratensis* var. *pallida* a *Hygrocybe virginea* var. *fuscescens*.

Key words: Agaricomycotina, Hygrophoraceae, waxcaps, grasslands, bogs, meadows, pastures, threat

Introduction

Hygrocybe species are bioindicators of conservation value of meadows or grasslands (Adamčík & Kautmanová 2005). They are colourful, usually red, orange or yellow coloured, some of *Cuphophyllus* species are brown, orange, whitish or white with brown tinges. In Europe, they can be found most often in so called „waxcap grasslands“, which are characterized by being unfertilised, short-sward (through grazing or mowing), moss-rich, and long-established (Griffith et al. 2002). They can be found also in bogs, heathlands, near the roads, at grassy places near houses or cottages, old overgrown stone pits, younger forests, bushes etc. (Boertmann 2010). Waxcap grasslands and their associated fungi (CHEG species – *Clavariaceae*, *Hygrocybe*, *Entoloma* and *Geoglossaceae*) are of conservation concern, since unfertilised grasslands (formerly commonplace) have declined dramatically as a result of changes in agricultural practice. As a result, by 1993, 89% of European *Hygrocybe* species appeared on one or more national red lists of threatened fungi (Griffith et al. 2002). Following the molecular phylogeny, European *Hygrocybe* species were splitted to six new genera: *Chromosera*, *Cuphophyllus*, *Gliophorus*, *Gloioxanthomyces*, *Hygrocybe* and *Porpolomopsis*. Some of these species can be distinguished by the macroscopic features, as well as by size and shape of the spores. However, some are very hard to identify, so genetic identification is often required (Lodge et al. 2014). This paper is the third part of the mycological survey of the genus *Hygrocybe* s. lat. in the Kysuce region. It is focused on knowledge about new localities of the 33 taxa of *Hygrocybe* s. lat. found during our recent research.

Material and Methods

This research follows two articles, both published in *Catathelasma* journal (Zajac & Zajacová 2013, Zajac et al. 2016). Studied material was collected in northwestern Slovakia, in six geomorphological areas (Jablunkovské medzihorie Mts., Javorníky Mts., Kysucké Beskydy Mts., Kysucká vrchovina Mts., Moravsko-sliezske Beskydy Mts., Turzovská

vrchovina Mts.). These areas are situated in Kysuce region and Považie region with total number of 108 localities of the genus *Hygrocybe* s. lat. (Fig. 1; CHKO = protected landscape area). The research was provided during five years (2014–2018). The nomenclature follows latest version of Index Fungorum (2019). The macro-morphological descriptions were based on fresh material. Both collections of species *Hygrocybe constrictospora* were microscopically identified. All basidiomata were cleaned and carefully dried, as soon as possible. For each taxon, localities were listed alphabetically within the geomorphological units. The geomorphological area, village or town, part of the village, type of locality with recent management, altitude, GPS coordinates (with the accuracy of 2–3 m), date, collector (initials of collectors: Filip Fuljer–FF, Milan Zajac–MZ, Zuzana Václavová–ZV), collection and voucher number for each specimen were specified. Species frequency was estimated in accordance with the following scale: 1–4 localities—very rare species, 5–9 localities—rare species, 10–19 localities—common species, 20 and more localities—very common species. The studied specimens are kept in private herbaria of autors (Filip Fuljer–PHFF and Milan Zajac–PMZ).

Results

Hygrocybe acutoconica agg.

A medium-sized species with characteristic yellow, orange-yellow or fully orange dry cap and stem. Cap is conical, gills are free or adnexed. Flesh and surface are non-blackening and stem is fibrillose. It belongs to very rare species in the studied area (but the species grew earlier, when we did not provide our research). It is rather common species in most of European countries (Boertmann 2010). Taxon should be complex of undescribed species, which are differentiated by surfaces of caps and stems, size of specimens, shape and size of spores.

Porpolomopsis calyptiformis (Berk.) Bresinsky

A medium-sized to large-sized species with typical pinkish cap, white gills and white stem. Cap is dry with characteristic conical shape. Although this species is included among 33 threatened fungi in Europe (Dahlberg & Croneborg 2003) and in the Red list of fungi of Slovakia (Lizoň 2001), it is quite common in Kysuce region and Javorníky Mts., but on the other hand it is rare to very rare species in Europe (Boertmann 2010).

Hygrocybe citrinovirens (J. E. Lange) Jul. Schäff.

A species with medium to large-sized, lemon yellow to greenish-yellow, non-blackening and dry basidiomata; radially fibrillose and conical cap and a smooth or finely fibrillose stem. It is listed in the IUCN Red List of Threatened Species (Kautmanová et al. 2015a). Although, Boertmann (2010) presented this species as a rare or very rare in Europe, it is very common species in Javorníky Mts. and Kysuce region.

Hygrocybe coccineocrenata (P. D. Orton) M. M. Moser

The small orange reddish species, characterised by a dry cap with black squamules and decurrent gills. The species could be found in moist places (peat bogs, moorlands or wet calcareous meadows (Boertmann 2010). This species is common in peat bogs in Kysuce region, but have not been recorded in Javorníky Mts. Rare species in whole Europe (Boertmann 2010).

Hygrocybe conica agg.

A species with variable-sized, yellow, orange to red basidiomata; ± conical cap with yellowish fibrillose stem that always becomes black when handled or with age. In our opinion, it should be complex of species, which are still not specifically named and distinguished. Very common species in Europe (Boertmann 2010) and also in the study area. It generally grows individually, or in the small groups, often in the fertilised meadows. It is very common species in Kysuce area and Javorníky mountains.

Javorníky Mts., Veľké Rovné, Melocík, cow-grazed pasture, alt. 793 m, 49°20'25.65"N 18°30'50.27"E, 13. Photo M. Zajac.

Hygrocybe constrictospora Arnolds

A small, reddish species with a dry cap and broadly adnate to decurrent gills. Species is characterised by shape of spores, which are oblong to cylindrical with median constriction, usually more than 75% spores are constricted (Boertmann 2010). We collected this species only at two localities; it is a very rare species in surveyed area. Rare or very rare species in Europe, but it should be also overlooked (Boertmann 2010).

Kysucká vrchovina Mts., Snežnica, over the football pitch, overgrown meadow with *Juniperus communis*, alt. 456 m, 49°16'03.9"N 18°47'15.2"E, 20. X. 2017, MZ, PMZ337. – Snežnica, Veľký Vreteň, overgrown meadow, alt. 511 m, 49°16'06"N 18°47'29.9"E, 20. X. 2017, MZ, PMZ339.

Cuphophyllus flavipes (Britzelm.) Bon

A medium-sized species with greyish to greyish-brown cap, whitish stem with yellowish base and decurrent gills. It is a rare or very rare species in Europe and it grows only in well-preserved, *Hygrocybe* species-rich grasslands (Boertmann 2010). It is a rare species in the research area, and also in Slovakia was collected only rarely (Zajac et al. 2016).

Javorníky Mts., Veľké Rovné, Kýčery, mesic mowed meadow near the cottage, alt. 632 m, 49°20'55.4"N 18°34'00.2"E, 27. X. 2017, MZ, FF, PMZ354, PHFF10203. **Turzovská vrchovina Mts.**, Korňa, Boháčovci, mesic mowed meadow, alt. 710 m, 49°26'33.97"N 18°31'47.92"E, 19. X. 2018, FF, PHFF10358.

Cuphophyllus fornicatus (Fr.) Lodge, Padamsee & Vizzini

A medium-sized to large-sized tricholomatoid species with a whitish, greyish or greyish brown cap, white, usually emarginate gills and a white stem, which sometimes has rusty spots at the base (Boertmann 2010). It is very rare species in Kysuce region and Javorníky mountains, recorded only at a few localities. Rare species in Europe, but locally common in British Isles (Boertmann 2010).

Javorníky Mts., Zákopčie, Petránky, mesic mowed meadow, sometimes cow-grazed, alt. 832 m, 49°22'39.78"N 18°43'53.72"E, 4. Hygrocybe glutinipes (J. E. Lange) R. Haller Aar.

A species with small, yellow to yellow-orange basidiomata, viscid cap and stem and adnate to subdecurrent gills. It is a rare species in Europe, but relatively common in the study area. It could be often undistinguished or probably often neglected because of its small sized basidiomata. Although, it was collected only 4 times in our surveyed area, it belongs to common species, because it has been found 8 times in the past by Zajac et al. (2016). Rare species in European countries (Boertmann 2010).

Hygrocybe chlorophana (Fr.) Wünsche

A species with medium-sized, yellow to orange-yellow basidiomata, viscid, smooth cap, sometimes finely squamulose on top, dry or moist stem and adnexed gills. . Common species in Scandinavia and British Isles, but rare in southern European countries (Boertmann 2010). Very common species in our surveyed area.

Hygrocybe ingrata J.P. Jensen & F.H.Møller

A medium-sized species with reddish-brown to orange-brown cap, cream coloured stem and gills. It smells nitrous and the flesh is reddening after cut. It is a rare species in Europe, listed in the IUCN Red List of Threatened

Species (Boertmann 2010, Kautmanová et al. 2015b). Although, we found this species at several localities it belongs to the common species in the Kysuce region, because it has been found 8 times in our studied area in the past (Zajac et al. 2016). Rare or very rare species in Europe (Boertmann 2010).

Hygrocybe insipida (J. E. Lange) M. M. Moser

A small-sized species, with yellowish, orangish lubricous cap, slightly decurrent gills coloured concolours like a cap and a moist stem when fresh. Stem top is more reddish like a rest of the stem (Boertmann 2010). It is a very common species in Kysuce region and Javorníky Mts., and we collected many basidiomata at various localities. Common in northern European countries, but rarer in southern Europe (Boertmann 2010).

Hygrocybe intermedia (Pass.) Fayod

A medium-sized to large species, characterised by orange to reddish cap, which is dry, fibrillose and squamulose, stem is fibrillose, too. Very rare species in Kysuce region and Javorníky Mts. Very rare species in whole Europe (Boertmann 2010).

Kysucká vrchovina Mts., Stará Bystrica, Soboľovci, mesic mowed meadow behind the cottage, alt. 567 m, 49°21'36.5"N 18°58'25.4"E, 21. IX. 2017, MZ, PMZ452.

Gliophorus irrigatus (Pers.) A..M. Ainsw. & P.M. Kirk

A species with brownish or greyish coloured basidiomata, viscid on both cap and stem. It was found at many localities during our research, we consider it a very common species in the Kysuce region. Occasional to rare species in European countries (Boertmann 2010).

Hygrocybe punicea (Fr.) P. Kumm.

A species with a medium to large basidiomata, dark red lubricous to viscid cap and coarsely fibrillose stem. It grows only in the meadows with highly conservation value (McHugh et al. 2001), often together with many other *Hygrocybe* species. It is very common species in Kysuce region. Due to rarity, it was classified as VU (vulnerable) species by IUCN (Mešić 2019). Common in Wales (UK), but rare in other European countries (Boertmann 2010).

Gliophorus reginae Dentinger, A. M. Ainsw. & P. F. Cannon

It is a medium-sized species, characterised by pinkish basidiomata, campanulate, later applanate cap (sometimes with umbo), smooth, lubricous. Gills are narrowly adnate, free or broadly adnate. Stipe is paler, less lubricous as a cap, sometimes decompressed. All collections from Slovakia are only from Javorníky Mts. where is rare. In Europe it has been collected in United Kingdom (Winnall 2013), Spain (Fidalgo 2017), Denmark (Boertmann 2010), Czech Republic (Ševčíková & Mička 2019), France (Lefebvre 2001) and Belgium (Lenaerts 2015).

Hygrocybe reidii Kühner

Small to medium-sized species, with dry, orange to orange-red cap, broadly adnate gills and very characteristic honey smell (Boertmann 2010). It is a common species in Kysuce region and Javorníky Mts. Common species in British Isles and Scandinavia, but rarer in southern European countries (Boertmann 2010).

Hygrocybe subpapillata Kühner

A species with small, reddish or orange basidiomata; lubricous, often papilate cap, dry stem and broadly adnate gills. It belongs to the rare species in Europe, but sometimes it is hard to identify it and it could also be often neglected (Boertmann 2010). It is very rare also in our study area. Rare and not well known species also should be overlooked (Boertmann 2010).

Kysucká vrchovina Mts., Povina, Tatarovci, mesic mowed meadow, alt. 539 m, 49°18'08.4"N 18°51'52.5"E, 26. IX. 2017, MZ, PMZ426.

Hygrocybe virginea* var. *fuscescens (Bres.) Arnolds

≡ *Cuphophyllus virgineus* var. *fuscescens* (Bres.) E. Campo

This variety differs from *Cuphophyllus virgineus* by brownish central spot on cap (Boertmann 2010). It is very rare taxon in our area.

Kysucká vrchovina Mts., Snežnica, between Malý and Veľký Vreteň, overgrown meadow, alt. 558m, 49°16'18.1"N 18°47'02.2"E, 20. X. 2017, MZ, PMZ324.

Cuphophyllus virgineus (Wulfen: Fr.) Kovalenko

≡ *Hygrocybe virginea* (Wulfen) P. D. Orton & Watling

A species with small to medium-sized, white basidiomata; slightly lubricous cap and decurrent gills. This species is relatively tolerant to the change of natural conditions in the biotopes and it belongs to the most common species in Europe and also in our study area (Boertmann 2010).

Discussion

We collected 33 taxa of *Hygrocybe* s. lat. during this research, including 8 species (*Cuphophyllus fornicatus*, *Gliophorus reginae*, *Hygrocybe constrictospora*, *H. mucronella*, *H. ovina*, *H. quieta*, *H. russocoriacea* and *H. splendidissima*) and 2 varieties (*Hygrocybe pratensis* var. *pallida* and *H. virginea* var. *fuscescens*) not recorded in previous research (Zajac & Zajacová 2013, Zajac et al. 2016). But 8 species known from the previous research were not re-collected (*Hygrocybe aurantiosplendens*, *H. glutinipes* var. *rubra*, *H. helobia*, *H. chlorophana* var. *aurantiaca*, *H.*

nitrata, *H. phaeococcinea*, *H. spadicea*, *H. turunda*). Totaly 40 *Hygrocybe* s. lat. species have been recorded in the study area (recent and past researches). The species richest localities (Table II.) were Skalité, Poľana (total number of 18 taxa); Horný Vadičov, L'adonhora (17); Nová Bystrica, Harvelka (15); Zákopčie, Petránky (15) and Vysoká nad Kysucou, Vrchríeka (15). These grasslands are mowed or extensively pastured for decades, without ploughing or manuring. New localities (Table III.) of very rare species (*Hygrocybe constrictospora* – 2 localities, *Hygrocybe intermedia* – 1, *Hygrocybe mucronella* – 3, *Hygrocybe ovina* – 1, *Hygrocybe russocoriacea* – 4, *Hygrocybe splendidissima* – 3, *Hygrocybe subpapillata* – 2) and rare species (*Cuphophyllus flavipes* – 2, *Cuphophyllus fornicatus* – 5, *Gliophorus reginae* – 6, *Hygrocybe miniata* – 4) were added. The most common species (*Hygrocybe virginea* – 64 localities, *Gliophorus psittacinus* – 57, *Hygrocybe chlorophana* – 47, *Cuphophyllus pratensis* – 46) occurring also on the fertilised meadows, strongly grazed meadows, slightly recultivated grasslands, etc. (associated with *Trifolium repens*, *Dactylis glomerata*, or *Leontodon autumnalis*). It is highly recommended to maintain "friendly" management of „waxcap grasslands“ to maintain the diversity of rare fungi. Such management should be focused on ecological farming, when productivity is not the primary need and is less important than the protection of biotopes (Ružičková et al. 2011).

Table II. The *Hygrocybe* s. lat. species at the richest localities in study area.

Locality	Years of recording			Number of visits (2012-2018)
	2012-2014	2014-2018	2012-2018	
Skalité, Poľana	15	10	18	3
Horný Vadičov, L'adonhora	0	17	17	4
Nová Bystrica, Harvelka	0	15	15	1
Zákopčie, Petránky	4	14	15	4
Vysoká nad Kysucou, Vrchríeka	13	7	15	4
Povina, Tatarovci	0	14	14	2
Oščadnica, Príslip	0	14	14	4
Krásno nad Kysucou, Zákysučie	0	13	13	3

Although *Hygrocybe acutoconica* belongs to very rare species and *Hygrocybe pratensis* var. *pallida* to rare species in Kysuce region and

Javorníky mountains, we must admit, that these species could be neglected and the main reason, why we found this species only a few times is, that both species fructificate much earlier than other CHEG species (from July to September). *Hygrocybe virginea* var. *fuscescens* belongs to very rare species, because almost all meadows and grassland in the researched area were acidic, only a few meadows were calcareous. The locality of *Hygrocybe spadicea* Čadca, Sihelník, total number of 16 species recorded in 2013 (Zajac et al. 2016) was completely fertilised in 2016, in 2017 only 3 species occurred on this meadow (on parts which were not so much fertilised).

Table III. The number of collections of *Hygrocybe* s. lat. species recorded during our recent and previous research.

Taxon	Number of localities 2014-2018	Number of localities 2008-2012, 2013-2014	Taxon	Number of localities 2014-2018	Number of localities 2008-2012, 2013-2014

PERROTIA FLAMMEA (HELOTIALES) IN SLOVAKIAAdam Polhorský¹ & Ján Červenka²¹Pezinská 14, 903 01 Senec, Slovakia; polhorsky.adam@gmail.com²Starhradská 6, 851 05 Bratislava, Slovakia; jancervenka.mail@gmail.com

Polhorský, A. & Červenka, J. 2020. *Perrotia flammea* (Helotiales) in Slovakia. *Catathelasma* 20: 57–66.

Perrotia flammea is a colourful member of *Lachnaceae* (Helotiales, Ascomycetes). Despite its characteristic appearance, the last known collection from Slovakia was made at the beginning of the 20th century. In 2018–2020 several new collections have been found. Detailed description of these specimens follows the standards of vital taxonomy. Figures illustrating its typical xeric habitat, macro- and microscopic characters are presented.

Polhorský, A. & Červenka, J. 2020. *Perrotia flammea* (Helotiales) na Slovensku. *Catathelasma* 20: 57–66.

Perrotia flammea je sýto sfarbeným zástupcom čeľade *Lachnaceae* (Helotiales, Ascomycetes). Napriek jej charakteristickému vzhľadu je posledný zber zo Slovenska známy zo začiatku 20. storočia. V rokoch 2018–2020 bola opäť nájdená na niekoľkých lokalitách. Podrobnej opis týchto vzoriek bol pripravený podľa štandardov vitálnej taxonómie. Sú prezentované obrázky znázorňujúce jej typické suchomilné prostredie, makro- a mikroskopické znaky.

Key words: fungi, Slovakia, Kmet', new record, Štiavnické vrchy Mts.

Introduction

The genus *Perrotia* was established by Boudier (1901) to house an ascomycete originally described in 1805 as *Peziza flammea* Alb. & Schwein. Its characters seemed to warrant a placement in a genus of its own (Delivorias et al. 2011). The genus contains 21 species, including the latest published *Perrotia microspora*, described from New Zealand (Verley 2004). The family *Hyaloscyphaceae* was subdivided and the genus was included into the newly proposed family *Lachnaceae* (Raitvīr 2004). *Perrotia* is characterized by sessile to short-stipitate apothecia, thick-walled hairs with incrusted to granulate walls, ascii with non-amyloid apex, variously shaped, aseptate to multiseptate spores. Species of this genus occur mostly on woody substrata, very rarely on gramineous plants and leaves of dicotyledons (Zhuang & Yu 2001).

According to collections of the Museum of Natural Sciences in Bratislava (BRA) *Perrotia flammea* was first recorded in Slovakia by Andrej Kmet' who collected it thirteen times in several locations (1887–1902). In 1888 it was also collected by Viktor Greschik in the vicinity of Levoča town. As far as we know, the last known material from 20th century comes from May 1912. It was collected by Johann Andreas Bäumler on Kamzík [Gemsenberg] hill above Bratislava. The collection is deposited in the Mycological Herbarium of the Phytopathological Research Station of the Tartu University (EAA) in Estonia (Elurikkus 2020). In March 2018 this interesting discomycete was found by Mikuláš Lazor in Eastern Slovakia. Recently senior author collected this fungus at three other sites.

The species occurs in several countries in the North America, Europe, the North Africa and in the Asian part of Turkey and Russia (Uzun et al. 2015, GBIF 2020).

Material and methods

Nikon Eclipse Ni-U microscope applying DIC and Nikon DS-Ri2 microscope camera were used for microphotography and Nikon D7000 with Sigma 150 mm f/2.8 APO DG HSM Macro and reverse mounted Sigma 50 mm f/2.8 DG Macro EX for macrophotography. Median sections of apothecia were done free-hand. The apothecia were examined in the fresh or rehydrated, living state in tap water. The description is based on living specimens following the method of vital taxonomy (Baral 1992). Minimum 20 measurements were made for ascospores and 10 for other characters. The measurements are noted as (min)avg-sd – avg+sd(max), where min (max) represents absolute minimal (maximal) value, avg – arithmetic mean, sd – standard deviation. KOH was added for measurement of dead elements. The iodine reaction was tested with Lugol's solution. Studied material is deposited in the Museum of Natural Sciences in Bratislava (BRA). Abbreviations: IKI = Lugol's solution ($\approx 1\%$ I₂, 3% KI, aqueous), KOH = potassium hydroxide, LBs = lipid bodies, VBs = refractive vacuolar bodies, * = living state, † = dead state, [x] = number of collections examined. OCL= oil (lipid) content index.

Results

Perrotia flammea (Alb. & Schwein.) Boud., *Bull. Soc. mycol. Fr.* 17: 24 (1901)

 = *Lachnella rhoina* Earle, in Greene, *Pl. baker.* 2(1): 6 (1901)
 = *Dasyscyphus allantospora* Earle [as *'Dasyscypha'*], in Greene, *Pl. baker.* 2(1): 5 (1901)

Apothecia (Figs. 1, 2a) fresh or rehydrated 0.4–1.7 mm in diam., receptacle up to 0.3 mm thick, deeply cupulate when young, finally flat, ± round to sometimes elongated by mutual pressure, non-gelatinous, scattered to densely gregarious, sessile; hymenium light yellow, ochraceous to yellow-orange, margin distinct, strongly protruding, densely covered with orange-red flexuous hairs; base black, lacking hairs, slightly pruinose. Ascii (Figs. 2b, e, g) *105–130 × 12.5–14 µm [2], †75–90 × 8.2–10.5 µm [2], cylindrical, 8-spored, spores biserrate or irregularly clumped at apex by turgor, † biserrate, basally subbiserrate, pars sporifera *30–43 µm long; apex *† hemispherical, *thin-walled [2], without dome, apical walls †0.5–0.9 µm thick, lateral walls †0.6–1.2 µm thick [1], IKI— (with or without KOH-pretreatment); base arising from croziers [2]. Ascospores (Fig. 2d) *(12.4–)13.2–17.5(–22) × (2.4–)3.5–4(–6) µm [2], †11.4–16 × 2.2–4 µm [2], mostly homopolar, allantoid, containing few minute LBs, OCL 0–1 [2], filled with non-refractive VBs, 0-septate, without sheath, without glycogen bodies; with one nucleus of 2.2–2.9 µm per cell, nucleolus 0.7–1.2 µm in diam., postmature spores 0–1-septate, germination or formation of conidia not observed. Paraphyses (Fig. 2c) cylindric-filiform, terminal cell *2–2.5 µm, †1–1.8 wide [1], tapering, uninflated, loosely encrusted with yellowish granules, without refractive VBs, with low amount of small LBs, not branching, sometimes basally anastomosing. Subhymenium well developed, composed of densely packed ± isodiametric cells, 3–6 µm in diam. Medullary excipulum 40–50 µm thick in median section, of somewhat loose, non-gelatinized *textura intricata*, distinctly delimited from ectal excipulum, cells *1.5–3.2 µm thick [1]. Ectal excipulum composed of two layers, inner layer 40–110 µm thick, strongly gelatinized *textura oblita* (Fig. 2i), with oxalate crystals (Fig. 2h), gel strongly staining deeply blue in KOH+IKI (Fig. 2k); cells *†1–2.5 µm in diam., hyaline, basally brownish; outer layer up to 45 µm thick, slightly or non-gelatinized, dark brown *textura angularis-globulosa*, with oxalate crystals, cells *†3–4.5 µm in diam. [1]. Hairs up to 250 µm long, 3–8 µm broad, cylindrical,

Fig. 1 *Perrotia flammea* apothecia in vivo: a, b, c – colonies on partially decorticated branches of angiosperm shrub (BRA CR32510); d – scattered apothecia on exposed, blackened branch of *Fagus sylvatica* (BRA CR32509). Scale bars: a = 5 mm; b, c = 1 mm; d = 0.5 mm.

multiseptate, tapering, blunt; walls 0.6–1.6 µm thick, apically hyaline, basally brown, densely covered with yellowish to reddish granules and oxalate crystals (Fig. 2f); granules dissolving in KOH, staining the medium red to purple (Fig. 2j). Anamorph not observed.

Habitat: collected in south-facing sites: shrub land with xerophilous vegetation (Fig. 3a), abandoned orchard (Fig. 3b), slope at the mountain ridge with relict *Pinus sylvestris* and *Fagus sylvatica* trees (Fig. 3c), in (0–)0.5–1.7 m above ground on mostly exposed (xeric), dead, completely or partially decorticated branches of *Malus* sp. [7], *Ligustrum vulgare* [3], *Fagus sylvatica* [2], *Carpinus betulus* [2], *Spiraea media* [1] and *Prunus spinosa* [1]. Assoc.: *Propolis farinosa* [1], *Hysterographium flexuosum* [1], *Cryptodiscus foveolaris* [1], *Orbilia* sp. [1], *Cordieritidaceae* ined. [1]. Alt.: 150–800 m (lowland to submontane). Phenology: probably throughout the year, I. (1 coll.), III. (3 coll.), IV. (3 coll.), V. (1 coll.), VI. (1 coll.), VII. (4 coll.), X. (1 coll.), XI. (3 coll.). Geology: limestone, wetterstein limestone, dolomite, andesite.

Specimens studied: Slovakia, Trenčín region, Vŕšatské Podhradie village, NR Vŕšatské bradlá, attached decorticated branch of *Fagus sylvatica*, 1.7 m above the ground, N49.06923° E18.15619°, alt. 788 m, 5 Jan. 2020, R. Rutkowski, A. Polhorský (BRA CR32422); Žilina region, Folkušová village, Pekárová hill, on partially decorticated attached branch of *Fagus sylvatica*, 1.5 m above the ground, N48.95388° E18.96159°, alt. 800 m, 29 Mar. 2018, A. Polhorský (BRA CR32509); Banská Bystrica region, Sklené Teplice town, on decorticated branch of *Carpinus betulus* [in ramo decort. Carpin bet.], 10 Jul. 1899, A. Kmet' (BRA CR32496, BRA CR32497); Prenčov village, Babí potok, on dead branch of *Ligustrum vulgare* [in ram. emort. Ligustri vulg.], 1 Jul. 1887, A. Kmet' (BRA CR32505); Prenčov village, Kiepa, decorticated, on buried wood of *Malus* sp. [in lignulo decorticato putr. Pyri mali], 24 Nov. 1887, A. Kmet' (BRA CR32506); Prenčov village, in the garden, on decorticated branch of *Malus sp.* [in ramo decort. Pyri malij], 18 Jul. 1898, A. Kmet' (BRA CR32500); Prenčov village, in the garden, on wood of *Malus sp.* [in ligno Pyri malij], 6 Oct. 1898, A. Kmet' (BRA CR32495); Prenčov village, Uhrínová [Uhrinojo dolinka], on decorticated branch of *Malus sp.* [in ram. decort. Pyri malij], 13 Jun. 1902, A. Kmet' (BRA CR32498); Prenčov village, Sitno, on decorticated, attached branches of *Malus sp.*, 0.5–1.5 m above ground, N48.39849° E18.89482°, alt. 665 m, 4 May 2018, A. Polhorský (BRA CR32508); Prešov region, Levoča [Lőcse] town, "Gr. Steingeräusch" forest, decorticated branches of *Malus sp.* [Lehámozzott vadalmifa (*Pirus malus* (L.) ágakom, "Gr. Steingeräusch" erdőben], 1888, V. Greschik (BRA CR32494); Košice region, Ladmovce village, "Baba" hill, on dead branches and trunks of unknown shrubs, alt. 150 m, 16 Mar. 2018, M. Lazor (BRA CR32510).

Other known material: Slovakia, Bratislava region, Bratislava city, Kamzík [Gemsenberg], 1 May 1912, J. A. Bäumler (EAA02325).

Discussion

The most important characters of *Perrotia flammea* are 0–1-septate ascospores and reddish-brown hairs on the outside of the apothecia (Zhuang & Yu 2001). The hairs are densely covered with the granules, which dissolve and turn violaceous in KOH (Vesterholt 2000). It is a plurivorous species with wide range of angiosperm substrates. It's been reported from *Malus*, *Carpinus*, *Liquidambar* (Fries 1821); *Crataegus rivularis*, *Rhus trilobata*, *Fendlera rupicola* (Earle 1901); *Corylus*, *Prunus*, *Salix* (Dennis 1978); *Alnus crispa* (Huhtinen 1984); *Fraxinus* sp., *Fraxinus ornus*, *Cornus sanguinea* (Krieglsteiner & Enderle 1987); *Fagus cf. moesiaca* (Matočec & Focht 2000); *Ligustrum vulgare*, *Pyrus communis* (Suková 2005); *Olea europaea*, *Fagus sylvatica* (Delvorias et al. 2011) and *Fagus* sp., *Quercus* sp. (Uzun et al. 2015). To this list we now add *Spiraea media*. Delvorias et al. (2011) also reports two finds on *Abies cephalonica*, occurrence on coniferous wood is exceptional in this species and in the whole genus as well. The genus *Perrotia* appears to be polyphyletic from the molecular standpoint. The type species – *P. flammea* remains isolated within the *Lachnaceae* family, whereas

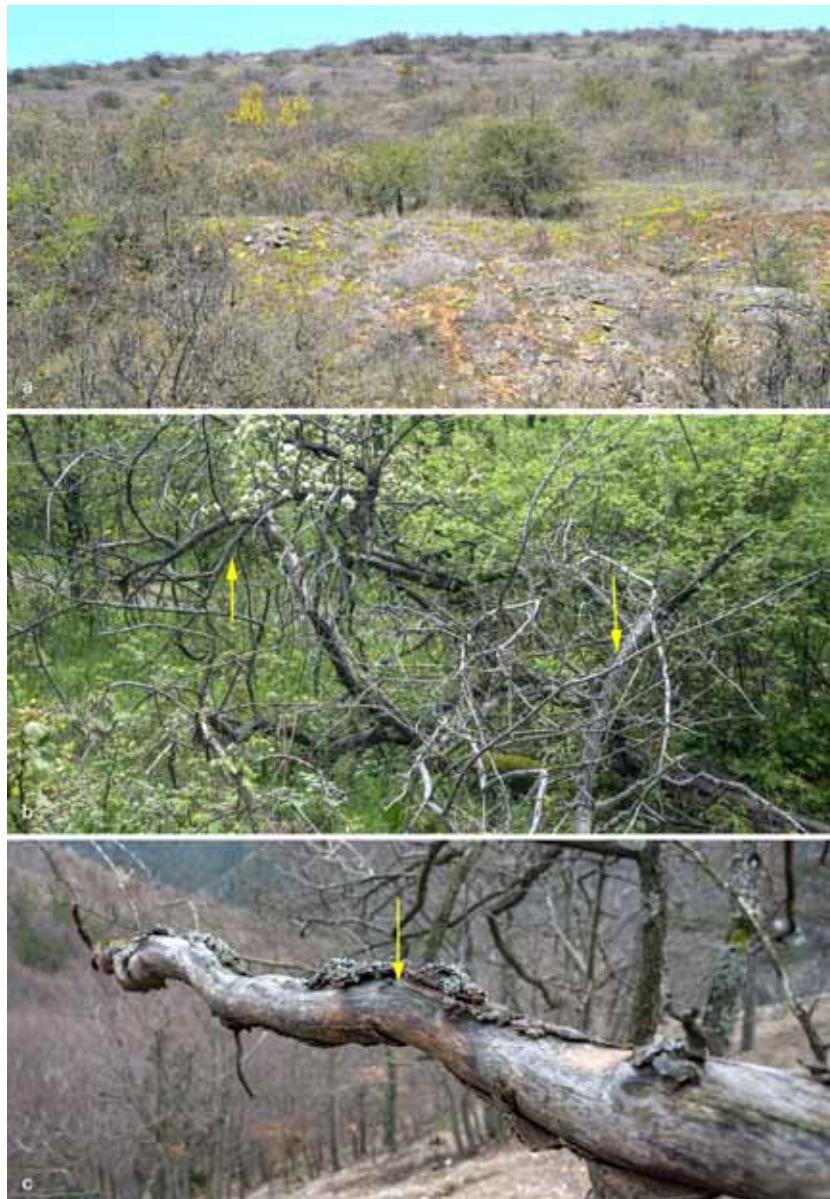

Fig. 3 *Perrotia flammea* habitats: a – view of the locality of BRA CR32510, b – decorticated *Malus* sp. branches (BRA CR32508), c – partially decorticated branch of *Fagus sylvatica* (BRA CR32509), arrows pointing to apothecia.

P. distincta, *P. populina*, *P. cf. succina* group with different *Lachnaceae* clades (Cantrell 1997, Baral 2014, Baral pers. comm.). As far as we know, *P. flammea* was collected 19 times in Slovakia, the historical records were restricted to Bratislava, Banská Bystrica and Prešov region, but based on our novel records the species also occurs in Trenčín, Žilina and Košice region. Despite its striking appearance and abundant apothelial growth the fungus has probably been overlooked for a long period since the most of the collections come from the late 19th and early 20th century.
